

Executive Summary: World of Warships Case Study

Business Task

To analyze the usage rates, in-game performance, and player engagement levels of Premium ships compared to Tech Tree ships. I will provide data-driven recommendations on what types of Premium ships Wargaming should focus on releasing next to maximize monetization and player retention.

Capitalize Tier 10 Engagement

Shift monetization toward the "end-game" by releasing more Tier 10 Special ships or pushing high-tier permanent camouflages, capturing players where they spend most of their time.

Expand "Black Edition" Model

The product team should replicate the successful formula of offering desirable Premium ships at discounted rates with exclusive skins during major seasonal events to drive revenue.

Proactive Balance Monitoring

The balancing team should monitor performance data to identify underperforming Premium ships. Buffing these outliers will improve player satisfaction and support future sales.

Conclusion

This case study reveals that standard Tier 10 Tech Tree vessels drive the vast majority of engagement, while "Black Edition" variants completely dominate in popularity. To maximize revenue and player retention, Wargaming should shift its monetization focus toward the Tier 10 end-game, replicate the highly successful Black Friday sales model for other seasonal events, and continuously monitor ship balance to ensure a fair yet economically rewarding experience.

Key Insights & Resources

Tech Tree ships are played significantly more (~3x) than purchased Premium ships.

Tier 10 Tech Tree vessels drive the highest overall game engagement.

"Black Edition" ships dominate engagement with **more total battles than all other events combined.**

Premium ships yield **19%** higher Average Base XP than Tech Tree counterparts.
